

GestaltView

Comprehensive Design Spec Package

Built from the uploaded theme package: 42 PNGs, 5 JPGs, 3 GIFs, and 1 markdown note.

Theme anchor: human consciousness x machine systems x survival-manual clarity

What this package does. It turns the uploaded visual corpus into an operational design system for brand, interface, diagrams, social assets, and motion. The materials clearly show two complementary modes: a dark neon cyber mode for live brand surfaces, and a warm parchment field-guide mode for explainers, manuals, and strategy visuals.

1. Source signals captured from the uploaded package

The package contains a surprisingly coherent universe rather than a random pile of images. Across the files, the same narrative engine appears repeatedly: a split brain or human-machine bridge, luminous circuit pathways, cosmos-scale framing, and richly annotated “survival manual” pages that translate abstract systems into practical guides.

A few details are explicit rather than inferred. The included markdown note identifies Cabin Sketch as the logo-font source in Canva, and the Canva screenshots visually confirm that Cabin Sketch was actively tested and selected for a GestaltView wordmark treatment. The same markdown note also includes Google Fonts references for Cabin Sketch, Frijole, Geist Mono, Josefin Sans, and Manrope, which gives a solid starting bench for system typography.

The asset set resolves into five working buckets: neon brand banners, parchment manual pages, systems diagrams and flow maps, social/distribution screenshots, and font research evidence. That is enough signal to standardize a real design system instead of just creating a moodboard.

PNG	JPG	GIF	Markdown
42	5	3	1

2. Brand essence

GestaltView should be treated as an intelligence companion brand, not a generic SaaS brand. The visual language does not sell speed alone. It sells recognition, orientation, translation, memory scaffolding, and companionship under cognitive load.

The recurring emotional register is “guidance through complexity.” In dark mode, the tone is luminous, futuristic, and alive. In parchment mode, the tone shifts into mapmaking, annotation, and survivability. Together they create a useful duality: wonder plus explanation.

Recommended core promise: make complexity legible without flattening human nuance.

3. Visual architecture: the two-mode system

Mode A: Neon signal layer

Use the neon system for hero banners, product headers, video bumpers, profile images, loading sequences, and anything that needs to feel like a living signal. This mode is anchored by obsidian backgrounds, electric cyan traces, violet and magenta glows, and sparse stars or particulate noise.

Mode B: Parchment field-guide layer

Use the parchment system for explainers, decks, manuals, investor-context pages, roadmaps, and educational graphics. This mode is grounded in warm paper tones, hand-annotated diagram energy, and organized callout clusters that make dense concepts feel navigable rather than sterile.

The right move is not to pick one mode and abandon the other. The better move is to define when each mode leads, and how they hand off. A common pattern is neon shell + parchment content core.

4. Color system

The uploaded work supports a split palette. The dark stack carries the live brand. The parchment stack carries explanation. Keep both official, with different usage weights.

Obsidian #05070B primary dark background	Electric Cyan #12D6FF signal traces and highlights	Ultraviolet #8A5CFF secondary glow and depth	Neon Magenta #FF3CAC energy, emphasis, path pulses
Soft Parchment #F5E9CF manual and explainer pages	Warm Ink #5E4B3C parchment text and icon strokes	Ember Gold #F7B267 callout warmth and priority accents	Success Mint #6EE7B7 positive status or completion

5. Typography system

Confirmed from the uploaded evidence

Cabin Sketch is the most concrete type choice in the package. The markdown note names it directly, and the Canva screenshot shows the GestaltView wordmark being set in Cabin Sketch. That makes it the safest official logo-display choice for source fidelity.

Recommended production hierarchy

Logo / expressive display: Cabin Sketch, used sparingly and mainly for the wordmark or occasional campaign moments. Structured headings: a clean modern sans such as Manrope or Aptos. Technical labels and system snippets: Geist Mono. Optional humanist contrast: Josefin Sans for elegant subheads or pull quotes.

Important guardrail: do not let Cabin Sketch leak into dense interface copy. It works as a signature texture, not as a default UI reading font.

6. Logo and banner rules

The strongest banner construction in the package follows a repeatable recipe: split-brain icon on the left, circuit rails extending horizontally, luminous wordmark centered or center-right, and a roomy black field for breath. The composition should feel like a transmission panel rather than a standard website header.

Preserve three signatures whenever possible: the dual-brain motif, left-to-right energy movement, and generous black negative space. Those three ingredients do most of the storytelling work.

Do	Don't
----	-------

Use the split-brain mark with circuit continuity	Replace the mark with generic AI sparkles
Let glow live around edges and traces	Apply heavy blur until the mark loses definition
Keep wide negative space around the wordmark	Crowd the banner with extra labels or badges
Use neon accents on near-black backgrounds	Use saturated neon on bright white without containment

7. Illustration and infographic language

The manual pages show a clear house style: parchment paper base, framed panels, diagram clusters, curved pathways, mini labels, and a lightly whimsical seriousness. The work looks technical, but not clinical. That is valuable because it makes intimidating systems feel habitable.

For future illustrations, keep the following constants: visible containers, named modules, handoff arrows, simple legends, and at least one “anchor object” per page such as a device, signal tower, archive, campfire, or engine. These anchor objects prevent diagrams from becoming abstract fog.

Label density should be high enough to reward close reading, but section grouping must stay obvious from far away. Think constellation, not clutter.

8. Layout, grid, and spacing

For digital surfaces, the system wants a 12-column desktop grid, 8-point spacing logic, and large hero gutters. For social graphics and diagram pages, asymmetry is acceptable as long as the reading path remains deliberate. Many uploaded pieces use strong left-to-right motion, which should remain a default composition bias.

Recommended spacing scale: 4, 8, 16, 24, 32, 48. Recommended corner radii: 8 for small chips, 16 for cards, 24 for hero containers. Recommended content max-width on dark pages: 1200 to 1320 px.

9. Motion and interaction

The GIF banners suggest that motion should be atmospheric instead of frantic. Preferred behaviors: soft glow pulsing, particle drift, trace travel, parallax star fields, and very slow energy waves across circuit lines. Avoid noisy “AI loading” clichés.

Suggested timing language: pulse 1.6s, banner ambient loop 2.2s to 3.2s, floating decorative elements 6s to 8s, hover responses 120ms to 180ms, page transitions 200ms to 280ms.

10. Product and social application rules

Use dark neon mode for the first impression: landing page hero, app shell header, social banner, and profile surfaces. Use parchment mode for second-click trust: methodology explainers, onboarding maps, feature deep dives, and founder-context material.

The Reddit and Discord screenshots in the package imply a community-facing brand. That means thumbnails and post cards should remain legible at tiny sizes. Favor one dominant object, one short title band, and one unmistakable GestaltView signature color.

11. Accessibility and governance

A neon brand can drift into illegibility very quickly. Standardize a few rails: body copy should almost always sit on matte dark surfaces without glow; glow belongs to accents, icons, strokes, and GestaltView design spec package

short display phrases. Keep regular text contrast high and preserve a non-glow fallback for every critical label.

Create final exports in pairs whenever possible: expressive version and plain-accessible version. This is especially important for diagrams that may end up in PDFs, slide decks, or small mobile screens.

12. Implementation package contents

This package includes a production-ready design document, a JSON token file, a CSS variables file, and a full asset manifest. That is enough to start a Figma library, a web theme, or a presentation template with much less reinvention.

GestaltView_Design_Spec.docx	primary editable reference
GestaltView_Design_Spec.pdf	portable review version
design_tokens.json	platform-neutral token source
theme_tokens.css	web implementation starter
asset_manifest.csv	inventory of the uploaded package

13. Final recommendations

Keep the dual-mode system. That is the signature. Standardize Cabin Sketch as the official logo-display source. Use a modern sans for the operating system around it. Promote the split-brain icon, circuit rails, and negative-space banner as fixed anchors. Use parchment explainers to earn trust after the neon layer captures attention.

In practical terms, the next best moves would be to build a Figma starter library with tokens, a website hero kit, and a presentation template using the same dark-neon shell plus parchment-content core. This package is designed so those next steps can happen without guesswork.
